Legend

- Major roads
- Major drainage
- Illawarra-Shoalhaven subtropical rainforest ecological community - Potential occurrences (based on mapping of Biometric Vegetation Types SR662 & SR568)
- Elevation/relief

Ground-truthing is required to verify if a particular site meets the required diagnostic characteristics and minimum condition thresholds to be the described ecological community. Minimum condition thresholds determine when a patch is considered too degraded to be a 'matter of national environmental significance', and are detailed in the Conservation Advice.

This map represents likely occurrences of the Illawarra-Shoalhaven subtropical rainforest ecological community based on comparable vegetation mapping data. At this resolution and scale many data points blend together to give an artificial impression of larger intact areas than actually remain. Some known occurrences are not represented on this map, e.g. sites in the Hacking River Catchment.

Method
Vegetation Units mapped are: SR568 and SR662. (1)
